EVOLVING HOME IN THE HILLS

Three white volumes organize this home for a couple and their grown daughters. In this second phase of an award-winning project, a temporary retreat evolved into a permanent residence containing a main suite, kitchen, dining room, large living area, and study with a full bath. The new structure has two stories on one side and one story on the other connected by a hallway running under the roof deck. An exterior wood staircase strategically connects the new structure to the original one. Standing-seam metal panels make up the wall and roof cladding, giving the simple gable forms a refined look, while a Lueders limestone wall begun during phase one now continues farther, creating a visual through-line that links the two phases together. The rich wood of the staircase and cantilevered “bento box” surrounding the dining room provides a warm contrast to the white cladding and stone wall. The material palette employed throughout the project demonstrates a careful selection process and features maple cladding and Turkish black marble on the interior. Now connected to each other and to the sloping landscape, the structures, old and new, give the homeowners a perfect sanctum to enjoy each other and the natural world around them.
